References

References are given in alphabetical order by author, and by date order under each author's name. The full title of each reference is given and the names of serial publications are fully written out. The date of publication of each entry which contains critical taxonomic data, as accurately as I have been able to determine it, is recorded in square brackets at the end of each entry. Standard Arabic numerals are used to indicate day and year, the number of the month is given in Roman numerals; hence [21.x.1946.] = twenty-first of October, 1946. In publications where only month and year of issue are given, the date of publication is taken as the last day of that month. In such cases the final day of the month is given in parentheses: [(30).ix.1980.] = (thirtieth) of September, 1980. This is to distinguish the entry from [30.ix.1980.], where the thirtieth of September is the actual date of publication. Similarly, in publications where only the year of issue is recorded, the date of publication is taken as the last day of that year, and both day and month are in parentheses [(31.xii).1923.], to distinguish it from an actual publication date of thirty-first of December, [31.xii.1923.]. For references which do not contain critical taxonomic data but which do contain important secondary information, only the year of publication is stated. In cases where I have not been able to see a particular reference, merely the year of publication is given followed by the statement "not seen" and if possible, an indication of where the reference was acquired, all enclosed within square brackets. When the real date of publication is later than that indicated on the title page, the year in which the publication actually appeared is given immediately after the author's name, and the apparent year is recorded in parentheses after the number of the volume or part in question.

- Kuznetsov-Ugamsky, N.N. Note. This name appears in many different spellings in the literature, e.g. Kuznetsov-Ugamskij, Kusnezow-Ugamsky, Kusnezov-Ugamsky, etc. The name is stabilised here at the above spelling, which is a modern transliteration from the Cyrillic alphabet version of the name. Post-1945 this author used the name Kusnezov, N., for which see above.

"This book will have permanent shelf life. All entomological libraries and entomologists with even a marginal interest in ants must have it, because its meticulously crafted synonymies cover all of ant classification from Linnaeus to the present."

—E. O. Wilson, Harvard University

"A name is forever, or at least as long as taxonomy continues," Barry Bolton writes, and here are all the names, antique and modern, of all the ants that are or ever were—from the arctic to the tropical, the fossilized to the living, the mislabeled to the newly christened members of the family Formicidae. For every name that has ever been applied to ants, the book supplies a history and an account of current usage, together with a fully documented indication of the present-day classification. Its comprehensive bibliography provides references to original description, synonymy, homonymy, changes in rank, status, and availability, and alterations in generic status.

Organized by family group, genus group, and species group, this meticulously detailed but easily used volume is the ultimate resource for myrmecology. Along with Bolton's *Identification Guide to the Ant Genera of the World*, it will be the essential reference for anyone, expert or amateur, with an interest in ants.

Barry Bolton is a Fellow of the Royal Entomological Society and Myrmecologist, Biodiversity Division, Department of Entomology, The Natural History Museum, London.
